

U5 PROJECT: WATER, WATER EVERYWHERE

In groups of 2 or 3 people, you have to elaborate a research project in which you will present your audience with **general information about water**:

- what's water and why is it so important?
- the approximate amount of water found on Earth
- the different types of water that can be found in nature and its different forms
- the historical importance of water for human civilisation
- examples of poems & songs in which water has an important role

After presenting this data, you must describe the different types of **pollution** affecting our oceans, rivers & lakes and provide information about global warming.

Moreover, using several first and second conditional sentences, you must point out **what will happen** if we don't take action NOW to stop global warming; and, if possible, **what would happen** if we, governments and citizens, reverted the consequences of water pollution.

The key concepts to include in your project are:

- water pollution
- eco-friendly alternatives
- recycling & upcycling
- global warming

Make sure to:

- include a cover page, an index, pictures, proper titles for the different parts of your project, slide/page numbers, a bibliography (including internet links, if necessary).
- use proper grammar and vocabulary included in the unit being covered.
- present your project orally at an appropriate pace.
- maintain posture and use the necessary body language to capture your listeners' interest.
- use original material, texts, not just "CUT & PASTE".

Your project must have a format supported by this platform, such as PDF or any kind of Google Document or Google Presentation. Microsoft or OpenOffice documents can also be used, but we cannot guarantee the correct display of such formats, which can result in a negative mark on your project.

The deadline to submit and/or present this project is 15th February, 2019.
